## Materials and methods

The CSS from $N$. meningitidis was produced by recombinant expression and purified as described earlier. ${ }^{[1]}$ The engineered $\alpha 2,3-S_{i a} T_{\text {pph_A151D }}$ from $P$. phosphoreum was produced and purified as described recently. ${ }^{[2]}$ Cresol red and CTP were purchased from Carl Roth, Germany. Neu5Ac was from R\&S Pharmchem, China. Column chromatography was performed on Roth silica gel (0.040-0.063 mesh); analytical thin layer chromatography was performed on Merck silica gel plates $60 \mathrm{~F}_{254}$ using anisaldehyde staining or $N$-(1-Naphthyl)-ethylenediamine for detection. Commercial reagents/solvents were used as received without further purification. Organic solvents were dried freshly by standard methods. NMR spectra were recorded on Bruker DRX500 spectrometer; chemical shifts are referenced to HOD, $\delta=4.79 \mathrm{ppm}$. For quantitative NMR measurements an accurate manual phase correction and a baseline correction with Whittaker Smoother method were performed using MestReNova 11.0.3. High-resolution mass data were determined on a Bruker Impact II ESI-Q-TOF spectrometer. Assays were measured using a SpectraMax 190 plate reader from Molecular Devices and SoftMax Pro 6.5 .1 software. TLC: all $R_{f}$ values are reported for the solvent mixture $\mathrm{n}-\mathrm{BuOH}:$ acetone $: \mathrm{H}_{2} \mathrm{O}: \mathrm{AcOH}=35: 35: 23: 7$. Organic solvents were removed under vacuum using a rotary evaporator, and residues were dissolved in $\mathrm{H}_{2} \mathrm{O}$ and lyophilized.

Compounds 4, 5 and $\mathbf{6}$ were prepared by adaption of reported literature procedures, ${ }^{[3]}$ however, no spectral data had been reported. More recently ${ }^{1} \mathrm{H}$ NMR data for 4 and 5 were recorded in MeOD solution. ${ }^{[4]}$ NMR-data for 6 are in accordance with recent literature data. ${ }^{[5]}$

## $N$-Acetyl-2-O-methyl- $\beta$-D-neuraminic acid methyl ester (4)

A mixture of $N$-acetyl-neuraminic acid (1) ( $4.00 \mathrm{~g}, 12.9 \mathrm{mmol}, 1.0 \mathrm{eq})$, freshly regenerated dry Dowex50 resin ( $\mathrm{H}^{+}$form; 7.80 g ) and molecular sieves ( $3 \AA$ ) in dry methanol ( 660 mL ) was heated to reflux for 24 h . The warm reaction mixture was filtered through celite and the solvent was removed in vacuo to obtain a yellow oil. The residue was dissolved in methanol ( 17 mL ), diluted with diethyl ether ( 45 mL ), and the mixture was refrigerated at $-25^{\circ} \mathrm{C}$ for 24 h . The crystalline solid was filtered off and washed with ether. This procedure was repeated for the filtrate ( MeOH :ether $=1: 3$ ). The product was obtained as a colorless crystalline solid ( $3.31 \mathrm{~g}, 76 \%$ ). $\mathrm{R}_{\mathrm{f}}=0.63$.

## $N$-Acetyl-2-O-methyl- $\beta$-D-neuraminic acid (5)

A solution of $4(2.20 \mathrm{~g}, 6.52 \mathrm{mmol}, 1.0 \mathrm{eq})$ in $0.06 \mathrm{~N} \mathrm{NaOH}(165 \mathrm{~mL}, 9.90 \mathrm{mmol}, 1.5 \mathrm{eq})$ was stirred at room temperature for 2.5 h . After completion the mixture was neutralized to pH 7.0 by swirling with Dowex-50 resin ( $\mathrm{H}^{+}$form; 2.5 g ). The suspension was filtered and the volume of the filtrate was reduced to 10 mL in vacuo. This solution was lyophilized to obtain a colorless crystalline solid ( 2.10 g , quant.). $R_{f}=0.21$.

After standing for 2 h in the dark at RT TLC showed completion. A solution of $\mathrm{Ba}(\mathrm{OAc})_{2}(117 \mathrm{~mL}, 0.1 \mathrm{M})$ was added to remove $\mathrm{IO}_{4}{ }^{-}$and $I^{-}$-salts. After complete precipitation, salts were filtered off and $\mathrm{CO}_{2}$ was bubbled through the solution to precipitate excess of barium. After filtration the solvent was removed under vacuum. Methyl 5-(acetylamino)-3,5-dideoxy- $\alpha$-L-arabino-heptulo-2,6-pyranosidaric acid 7-(3-pentyl)amide (21)

A solution of $\mathbf{2 0}$ ( $375 \mathrm{mg}, 1.04 \mathrm{mmol}, 1$ eq.) in $0.06 \mathrm{~N} \mathrm{NaOH}(30 \mathrm{~mL})$ was stirred at RT for 3 h . After complete conversion the mixture was neutralized to pH 7.0 by addition of Dowex50 $\mathrm{H}^{+}(2.5 \mathrm{~g})$. The suspension was filtered and the volume of the filtrate reduced to approximately 10 mL in vacuo. This solution was lyophilized to obtain a colorless crystalline solid.
