

Supplementary Material

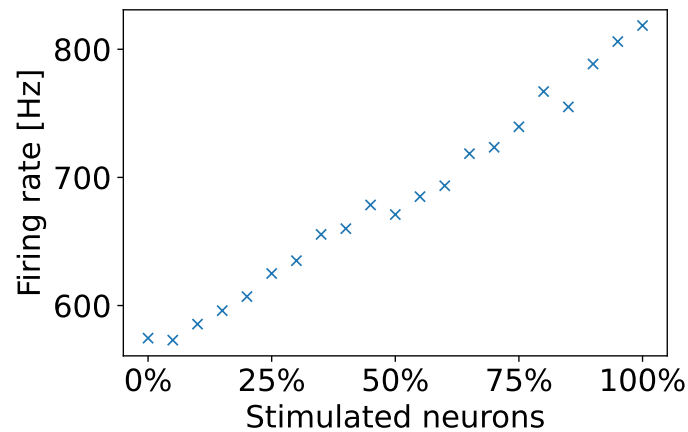

Figure S1. Firing rate during pattern retrieval. The normal firing rate of the readout neuron without any stimulation has a mean of $\mu = 574.5$ Hz and a standard deviation $\sigma = 29.3$. When we stimulated an increasing number of neurons in the ensemble C1, the firing rate of the readout neuron of the associated readout neuron fired at an increasing rate. There are three exceptions where an increase of the number of stimulated neurons about 5% do not increase the firing rate.

Figure S2. Histogram of the recorded firing rates of the readout neurons (blue bars) and the assumed normal distribution (orange lines) with a mean of 570.95 Hz and a standard deviation of 4.72.
